Description

According to the API requirements, the password must match the expected value **exactly**. Partial password matches must be rejected.

The API accepts a password that is only a prefix of the correct password and returns a valid authentication token.

Environment

- macOS Sonoma Version 14.5
- Google Chrome Version 150.0.7871.187
- `http://localhost:3001`
- POST `/login`

Preconditions

- API is running.
- `/login` endpoint is available.
- Valid username is `manager`.

Steps to reproduce

1. Send a POST request to: `http://localhost:3001/login`
2. Set `Content-Type: application/json`.
3. Use the following request body: Username: manager
   Password: Hotel2024
4. Send the request.

Expected result

- HTTP status: **401 Unauthorized**
- Response body: "reason": "Bad credentials"
- No authentication token is returned.
- The password must match the complete password `Hotel2024!`.

Actual result

- HTTP status: **200 OK**
- Response contains an authentication token:`"token": "..."`
